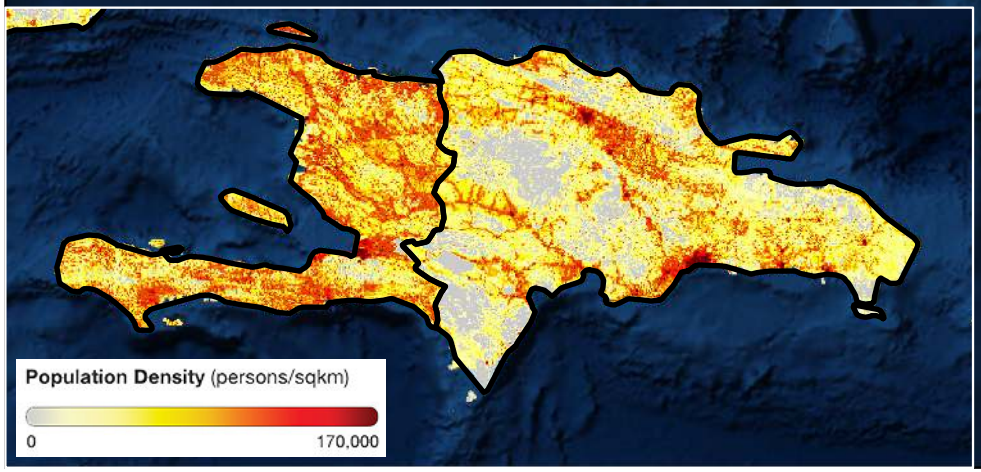
N



This dataset includes an estimate of the annual frequency of landslide triggered by precipitation. It depends on the combination of trigger and susceptibility defined by six parameters: slope factor, lithological (or geological) conditions, soil moisture condition, vegetation cover, precipitation and seismic conditions. Unit is expected annual probability and percentage of pixel of occurrence of a potentially destructive landslide event x 1,000,000. This product was modeled using global data.

For additional Landslide Hazard information please refer to DisasterAWARE.

The delineation of political boundaries, and associated data shown here do not imply endorsement by the Pacific Disaster Center.

Landslide Frequency (Precipitation)
High
Low
